(Note 1) The deviation parameters $\Delta V_{\text{REF}}/\Delta T_A$ and $\Delta I_{\text{REF}}/\Delta T_A$ are defined as the differences between the maximum and minimum values obtained over the recommended temperature range. The average full-range temperature coefficient of the reference voltage, αV_{REF} , is defined as:

$$|\alpha V_{\text{REF}}| (\text{ppm}/^\circ\text{C}) = \frac{\left(\frac{V_{\text{I(dev)}}}{V_{\text{REF}} \text{ at } 25^\circ\text{C}} \right) \times 10^6}{\Delta T_A}$$

Where:

ΔT_A is the recommended operating free-air temperature range of the device.

αV_{REF} can be positive or negative, depending on whether minimum V_{REF} or maximum V_{REF} , respectively, occurs at the lower temperature.

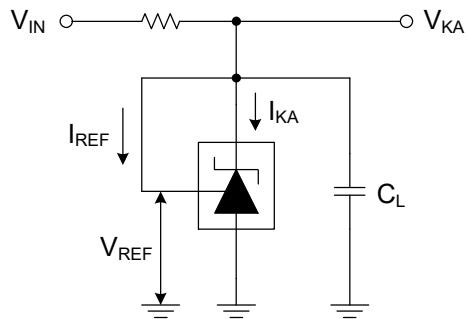

(Note 2) The dynamic impedance is defined as: $|Z_{\text{KA}}| = \frac{\Delta V_{\text{KA}}}{\Delta I_{\text{KA}}}$

When the device is operating with two external resistors, the total dynamic impedance of the circuit is given by:

$$|Z| = \frac{\Delta V}{\Delta I} \approx |Z_{\text{KA}}| (1 + R_1/R_2)$$
